Subject: Media inquiry

Hello,
I am trying to put the current oil spill in Lake Michigan in context for our viewers. This is crude oil, between 378-756 gallons. I want to compare it with the Enbridge oil spill in the Kalamazoo River from a few years back, about 843,000 gallons. My question is whether that was also crude oil, or if I'm looking at a apples-to-oranges comparison here.

Thank you,

Craig Scott
